## What is a good problem, for a cryptographer?

- Almost all of its instances must be hard to solve.

Attacks must be too expensive.

- Its instances must be easy to sample.

The algorithms run by honest users should be efficient.

- The problem must be (algebraically) rich/expressive.

So that interesting models of attacks can be handled, even for advanced cryptographic functionalities.

## The Learning With Errors problem

## Informal definition

Solve a random system of $m$ noisy linear equations and $n$ unknowns modulo an integer $q$, with $m \gg n$.

## The Learning With Errors problem

## Informal definition

Solve a random system of $m$ noisy linear equations and $n$ unknowns modulo an integer $q$, with $m \gg n$.

- The best known algorithms are exponential in $n \log q$.
- Sampling an instance costs $\mathcal{O}(m n \log q)$.

Very often, $m=\mathcal{O}(n \log q)$, so this is $\mathcal{O}\left((n \log q)^{2}\right)$.

- Very rich/expressive
encryption [Re05], ID-based encr. [GePeVa08], fully homomorphic
encr. [BrVa11], attribute-based encr. [GoVaWe13], etc.

## The Learning With Errors problem

## Informal definition

Solve a random system of $m$ noisy linear equations and $n$ unknowns modulo an integer $q$, with $m \gg n$.

- Sampling an instance costs $\mathcal{O}(m n \log q)$.

Very often, $m=\mathcal{O}(n \log q)$, so this is $\mathcal{O}\left((n \log q)^{2}\right)$.

- Very rich/expressive:
encryption [Re05], ID-based encr. [GePeVa08], fully homomorphic encr. [BrVa11], attribute-based encr. [GoVaWe13], etc.

## Goals of this talk

- Introduce LWE.
- Show the relationship between LWE and lattices.
- Use LWE to design a public-key encryption scheme.
- Give some open problems.

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

## Gaussian distributions

Continuous Gaussian of parameter s:

$$
\begin{aligned}
& D_{s}(x) \sim \frac{1}{s} \exp \left(-\pi \frac{x^{2}}{s^{2}}\right) \\
& \forall x \in \mathbb{R}
\end{aligned}
$$

## Gaussian distributions

Continuous Gaussian of parameter s:

$$
\begin{aligned}
& D_{s}(x) \sim \frac{1}{s} \exp \left(-\pi \frac{x^{2}}{s^{2}}\right) \\
& \forall x \in \mathbb{R}
\end{aligned}
$$

Discrete Gaussian of support $\mathbb{Z}$ and parameter s:

$$
\begin{aligned}
& D_{\mathbb{Z}, s}(x) \sim \frac{1}{s} \exp \left(-\pi \frac{x^{2}}{s^{2}}\right) \\
& \forall x \in \mathbb{Z}
\end{aligned}
$$

## Gaussian distributions

Continuous Gaussian of parameter s:

$$
\begin{aligned}
& D_{s}(x) \sim \frac{1}{s} \exp \left(-\pi \frac{x^{2}}{s^{2}}\right) \\
& \forall x \in \mathbb{R}
\end{aligned}
$$

Discrete Gaussian of support $\mathbb{Z}$ and parameter s:

$$
\begin{aligned}
& D_{\mathbb{Z}, s}(x) \sim \frac{1}{s} \exp \left(-\pi \frac{x^{2}}{s^{2}}\right) \\
& \forall x \in \mathbb{Z}
\end{aligned}
$$

- That's not the rounding of a continuous Gaussian.
- One may efficiently sample from it.
- The usual tail bound holds.

## The LWE problem [Reos]

Let $n \geq 1, q \geq 2$ and $\alpha \in(0,1)$.
For all $\mathbf{s} \in \mathbb{Z}_{q}^{n}$, we define the distribution $D_{n, q, \alpha}(\mathbf{s})$ :
$(\mathbf{a},\langle\mathbf{a}, \mathbf{s}\rangle+e) \in \mathbb{Z}_{q}^{n} \times \mathbb{Z}_{q}$, with $\mathbf{a} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$ and $e \hookleftarrow D_{\mathbb{Z}, \alpha q}$.

## The LWE problem [Reos]

Let $n \geq 1, q \geq 2$ and $\alpha \in(0,1)$.
For all $\mathbf{s} \in \mathbb{Z}_{q}^{n}$, we define the distribution $D_{n, q, \alpha}(\mathbf{s})$ :
$(\mathbf{a},\langle\mathbf{a}, \mathbf{s}\rangle+e) \in \mathbb{Z}_{q}^{n} \times \mathbb{Z}_{q}$, with $\mathbf{a} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$ and $e \hookleftarrow D_{\mathbb{Z}, \alpha q}$.

## Search LWE

For all s: Given arbitrarily many samples from $D_{n, q, \alpha}(\mathbf{s})$, find $\mathbf{s}$.
(Information-theoretically, $\approx n \frac{\log q}{\log 1 / \alpha}$ samples uniquely determine s.)

## The LWE problem [Reos]

Let $n \geq 1, q \geq 2$ and $\alpha \in(0,1)$.
For all $\mathbf{s} \in \mathbb{Z}_{q}^{n}$, we define the distribution $D_{n, q, \alpha}(\mathbf{s})$ :
$(\mathbf{a},\langle\mathbf{a}, \mathbf{s}\rangle+e) \in \mathbb{Z}_{q}^{n} \times \mathbb{Z}_{q}$, with $\mathbf{a} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$ and $e \hookleftarrow D_{\mathbb{Z}, \alpha q}$.

## Search LWE

For all $\mathbf{s}$ : Given arbitrarily many samples from $D_{n, q, \alpha}(\mathbf{s})$, find $\mathbf{s}$.
(Information-theoretically, $\approx n \frac{\log q}{\log 1 / \alpha}$ samples uniquely determine s.)

## Decision LWE

With non-negligible probability over $\mathbf{s} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$ : distinguish between the distributions $D_{n, q, \alpha}(\mathbf{s})$ and $U\left(\mathbb{Z}_{q}^{n+1}\right)$.
(Non-negligible: $1 /(n \log q)^{c}$ for some constant $c>0$.)

## Decision LWE

Let $n \geq 1, q \geq 2$ and $\alpha \in(0,1)$.
For all $\mathbf{s} \in \mathbb{Z}_{q}^{n}$, we define the distribution $D_{n, q, \alpha}(\mathbf{s})$ :

$$
(\mathbf{a},\langle\mathbf{a}, \mathbf{s}\rangle+e), \text { with } \mathbf{a} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right) \text { and } e \hookleftarrow D_{\mathbb{Z}, \alpha q} .
$$

## Decision LWE

With non-negligible probability over $\mathbf{s} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$ : distinguish between the distributions $D_{n, q, \alpha}(\mathbf{s})$ and $U\left(\mathbb{Z}_{q}^{n+1}\right)$.

We are given an oracle $\mathcal{O}$ that produces independent samples from always the same distribution, which is:

- either $D_{n, q, \alpha}(\mathbf{s})$ for a fixed $\mathbf{s}$,
- or $U\left(\mathbb{Z}_{q}^{n+1}\right)$.

We have to tell which, with probability $\geq \frac{1}{2}+\frac{1}{(n \log q)^{\Omega(1)}}$.

## Search LWE $\equiv$ solving noisy linear systems

Find $s_{1}, s_{2}, s_{3}, s_{4}, s_{5} \in \mathbb{Z}_{23}$ such that:

$$
\begin{aligned}
s_{1}+22 s_{2}+17 s_{3}+2 s_{4}+s_{5} & \approx 16 \bmod 23 \\
3 s_{1}+2 s_{2}+11 s_{3}+7 s_{4}+8 s_{5} & \approx 17 \bmod 23 \\
15 s_{1}+13 s_{2}+10 s_{3}+s_{4}+22 s_{5} & \approx 3 \bmod 23 \\
17 s_{1}+11 s_{2}+s_{3}+10 s_{4}+3 s_{5} & \approx 8 \bmod 23 \\
2 s_{1}+s_{2}+13 s_{3}+6 s_{4}+2 s_{5} & \approx 9 \bmod 23 \\
4 s_{1}+4 s_{2}+s_{3}+5 s_{4}+s_{5} & \approx \\
11 s_{1}+12 s_{2}+5 s_{3}+s_{4}+9 s_{5} & \approx
\end{aligned}
$$

We can even ask for arbitrarily many noisy equations.

## Matrix version of LWE

- $\mathbf{A} \hookleftarrow U\left(\mathbb{Z}_{q}^{m \times n}\right)$,
- $\mathbf{s} \hookleftarrow U\left(\mathbb{Z}_{q}^{n}\right)$,
- $\mathbf{e} \hookleftarrow D_{\mathbb{Z}^{m}, \alpha q}$.

Discrete Gaussian error

Decision LWE:
Determine whether $(\mathbf{A}, \mathbf{b})$ is of the form above, or uniform.

## Some simple remarks

- If $\alpha \approx 0$, LWE is easy to solve.
- If $\alpha \approx 1$, LWE is trivially hard.
- Very often, we are interested in

$$
\alpha \approx \frac{1}{n^{c}}, q \approx n^{c^{\prime}}, \text { for some constants } c^{\prime}>c>0
$$

- Why a discrete Gaussian noise?

## Why is LWE interesting for crypto?

- LWE is just noisy linear algebra: Easy to use, expressive.
- LWE seems to be a (very) hard problem.

## Why is LWE interesting for crypto?

- LWE is just noisy linear algebra: Easy to use, expressive.
- LWE seems to be a (very) hard problem.

Two particularly useful properties:

- Unlimited number of samples.
- Random self-reducibility over s.

If $q$ is prime and $\leq n^{\mathcal{O}(1)}$, there are polynomial-time reductions between the Search and Decision versions of LWE [Re05].
(We may remove these assumptions, if we allow some polynomial blow-up on $\alpha$.)

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

## Public-key encryption

A public-key encryption scheme over $\{0,1\} \times \mathcal{C}$ consists in three algorithms:

- KEyGEN: Security parameter $\mapsto(p k, s k)$.
- Enc: $\quad(p k, M) \mapsto C \in \mathcal{C}$.
- DEC: $\quad(s k, C) \mapsto M^{\prime} \in\{0,1\}$.

## Public-key encryption

A public-key encryption scheme over $\{0,1\} \times \mathcal{C}$ consists in three algorithms:

- KEyGEN: Security parameter $\mapsto(p k, s k)$.
- Enc: $\quad(p k, M) \mapsto C \in \mathcal{C}$.
- DEC: $\quad(s k, C) \mapsto M^{\prime} \in\{0,1\}$.

## Correctness

With probability $\approx 1, \forall M \in\{0,1\}: \operatorname{DEC}_{s k}\left(\operatorname{Enc}_{p k}(M)\right)=M$.

## Public-key encryption

A public-key encryption scheme over $\{0,1\} \times \mathcal{C}$ consists in three algorithms:

- KEyGEN: Security parameter $\mapsto(p k, s k)$.
- Enc: $\quad(p k, M) \mapsto C \in \mathcal{C}$.
- DEC: $\quad(s k, C) \mapsto M^{\prime} \in\{0,1\}$.

## Correctness

With probability $\approx 1, \forall M \in\{0,1\}: \operatorname{DEC}_{s k}\left(\operatorname{Enc}_{p k}(M)\right)=M$.

## Security (IND-CPA)

The distributions of $\left(p k, \operatorname{Enc}_{p k}(0)\right)$ and ( $p k, \operatorname{Enc}_{p k}(1)$ ) must be computationally indistinguishable.

## Regev's encryption scheme

- Parameters: $n, m, q, \alpha$.
- Keys: $\mathrm{sk}=\mathbf{s}$ and $\mathrm{pk}=(\mathbf{A}, \mathbf{b})$, with $\mathbf{b}=\mathbf{A} \mathbf{s}+\mathrm{e}$
- $\operatorname{ENC}(M \in\{0,1\})$ : Let $\mathbf{r} \hookleftarrow U\left(\{0,1\}^{m}\right)$,

## Regev's encryption scheme

- Parameters: $n, m, q, \alpha$.
- Keys: $\mathrm{sk}=\mathbf{s}$ and $\mathrm{pk}=(\mathbf{A}, \mathbf{b})$, with $\mathbf{b}=\mathbf{A} \mathbf{s}+\mathrm{e}$
- $\operatorname{ENC}(M \in\{0,1\})$ : Let $\mathbf{r} \hookleftarrow U\left(\{0,1\}^{m}\right)$,

- $\operatorname{DEC}(\mathbf{u}, v):$ Compute $v-\mathbf{u}^{T} \mathbf{s}$ (modulo $\left.q\right)$.

If it's close to 0 , output 0 , else output 1 .

## Decryption correctness

## Correctness

Assume that $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$.
Then, with probability $\geq 1-n^{-\omega(1)}$, it correctly decrypts.

## Decryption correctness

## Correctness

Assume that $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$.
Then, with probability $\geq 1-n^{-\omega(1)}$, it correctly decrypts.
We have

$$
v-\mathbf{u}^{T} \mathbf{s}=\mathbf{r}^{T} \mathbf{e}+\lfloor q / 2\rfloor M \bmod q .
$$

As $\mathbf{e} \sim D_{\mathbb{Z}, \alpha q}^{m}$, we expect $\langle\mathbf{r}, \mathbf{e}\rangle$ to behave like $D_{\|r\| \alpha q}$.

## Decryption correctness

## Correctness

Assume that $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$.
Then, with probability $\geq 1-n^{-\omega(1)}$, it correctly decrypts.
We have

$$
v-\mathbf{u}^{T} \mathbf{s}=\mathbf{r}^{T} \mathbf{e}+\lfloor q / 2\rfloor M \bmod q .
$$

As $\mathbf{e} \sim D_{\mathbb{Z}, \alpha q}^{m}$, we expect $\langle\mathbf{r}, \mathbf{e}\rangle$ to behave like $D_{\|r\| \alpha q}$.
As $\|\mathbf{r}\| \leq \sqrt{m}$, we have $\|\mathbf{r}\| \alpha q \leq o\left(\frac{q}{\sqrt{\log n}}\right)$, and
a sample from $D_{\|r\| \alpha q}$ is $<q / 8$ with probability $\geq 1-n^{-\omega(1)}$.

## Decryption correctness

## Correctness

Assume that $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$.
Then, with probability $\geq 1-n^{-\omega(1)}$, it correctly decrypts.
We have

$$
v-\mathbf{u}^{T} \mathbf{s}=\mathbf{r}^{T} \mathbf{e}+\lfloor q / 2\rfloor M \quad \bmod q
$$

As $\mathbf{e} \sim D_{\mathbb{Z}, \alpha q}^{m}$, we expect $\langle\mathbf{r}, \mathbf{e}\rangle$ to behave like $D_{\|r\| \alpha q}$.
As $\|\mathbf{r}\| \leq \sqrt{m}$, we have $\|\mathbf{r}\| \alpha q \leq o\left(\frac{q}{\sqrt{\log n}}\right)$, and
a sample from $D_{\|r\| \alpha q}$ is $<q / 8$ with probability $\geq 1-n^{-\omega(1)}$.
$\Rightarrow$ We know $\mathbf{r}^{T} \mathbf{e}+\lfloor q / 2\rfloor M$ over the integers.

## IND-CPA Security

## Security

Assume that $m=\Omega(n \log q)$. Then any (IND-CPA) attacker may be turned into an algorithm for $\mathrm{LWE}_{n, q, \alpha}$.

## IND-CPA Security

## Security

Assume that $m=\Omega(n \log q)$. Then any (IND-CPA) attacker may be turned into an algorithm for $\mathrm{LWE}_{n, q, \alpha}$.

## Fake security experiment

Challenger uses and gives to the attacker a uniform pair ( $\mathbf{A}, \mathbf{b}$ ) (instead of $\mathbf{b}=\mathbf{A} \cdot \mathbf{s}+\mathbf{e}$ ).

## IND-CPA Security

## Security

Assume that $m=\Omega(n \log q)$. Then any (IND-CPA) attacker may be turned into an algorithm for $\mathrm{LWE}_{n, q, \alpha}$.

## Fake security experiment

Challenger uses and gives to the attacker a uniform pair ( $\mathbf{A}, \mathbf{b}$ ) (instead of $\mathbf{b}=\mathbf{A} \cdot \mathbf{s}+\mathbf{e}$ ).
(1) If attacker behaves differently than in real security experiment, it can be used to solve LWE.

## IND-CPA Security

## Security

Assume that $m=\Omega(n \log q)$. Then any (IND-CPA) attacker may be turned into an algorithm for $\mathrm{LWE}_{n, q, \alpha}$.

## Fake security experiment

Challenger uses and gives to the attacker a uniform pair (A, b) (instead of $\mathbf{b}=\mathbf{A} \cdot \mathbf{s}+\mathbf{e}$ ).
(1) If attacker behaves differently than in real security experiment, it can be used to solve LWE.
(2) In fake experiment, $\left(\mathbf{A}, \mathbf{b}, \mathbf{r}^{\top} \mathbf{A}, \mathbf{r}^{\top} \mathbf{b}\right)$ is $\approx$ uniform, hence $\operatorname{Enc}(0)$ and $\operatorname{Enc}(1)$ follow $(\approx)$ the same distribution.

## Setting the parameters: $n, m, \alpha, q$

- Correctness: $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$
- Reducing LWE to IND-CPA security: $m \geq \Omega(n \log q)$

## Setting the parameters: $n, m, \alpha, q$

- Correctness: $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$
- Reducing LWE to IND-CPA security: $m \geq \Omega(n \log q)$
(1) Set $\alpha$ as large as possible ( $\alpha$ impacts security)
(2) Set $m$ as small as possible ( $m$ impacts efficiency)
(0) Set $n$ and $q$ so that $\mathrm{LWE}_{n, q, \alpha}$ is sufficiently hard to solve

Here: $\alpha=\widetilde{\Theta}(\sqrt{n}), m=\widetilde{\Theta}(n)$ and $q=\widetilde{\Theta}(n)$.

## Setting the parameters: $n, m, \alpha, q$

- Correctness: $\alpha \leq o\left(\frac{1}{\sqrt{m \log n}}\right)$
- Reducing LWE to IND-CPA security: $m \geq \Omega(n \log q)$
(1) Set $\alpha$ as large as possible ( $\alpha$ impacts security)
(2) Set $m$ as small as possible ( $m$ impacts efficiency)
- Set $n$ and $q$ so that $\mathrm{LWE}_{n, q, \alpha}$ is sufficiently hard to solve

Here: $\alpha=\widetilde{\Theta}(\sqrt{n}), m=\widetilde{\Theta}(n)$ and $q=\widetilde{\Theta}(n)$.
This is not very practical... ciphertext expansion: $\widetilde{\Theta}(n)$.

## Multi-bit Regev

- Parameters: $n, m, q, \alpha, \ell$.
- Keys: $s k=\mathbf{S} \in \mathbb{Z}_{q}^{n \times \ell}$ and $p k=(\mathbf{A}, \mathbf{B})$, with

$$
\mathbf{B}=\mathbf{A} \mathbf{S}+\mathbf{E}
$$

- $\operatorname{ENC}\left(\mathbf{M} \in\{0,1\}^{\ell}\right)$ : Let $\mathbf{r} \hookleftarrow U\left(\{0,1\}^{m}\right)$,

- $\operatorname{DEC}(\mathbf{u}, \mathbf{v})$ : Compute $\mathbf{v}^{T}-\mathbf{u}^{\top} \mathbf{S}$ (modulo $q$ ).

## Multi-bit Regev

- Parameters: $n, m, q, \alpha, \ell$.
- Keys: $\mathrm{sk}=\mathbf{S} \in \mathbb{Z}_{q}^{n \times \ell}$ and $\mathrm{pk}=(\mathbf{A}, \mathbf{B})$, with

$$
\mathbf{B}=\mathbf{A} \mathbf{S}+\mathbf{E}
$$

- $\operatorname{ENC}\left(\mathbf{M} \in\{0,1\}^{\ell}\right)$ : Let $\mathbf{r} \hookleftarrow U\left(\{0,1\}^{m}\right)$,

- $\operatorname{DEC}(\mathbf{u}, \mathbf{v})$ : Compute $\mathbf{v}^{T}-\mathbf{u}^{T} \mathbf{S}$ (modulo $q$ ).

Asymptotic performance, for $\ell=n$

- Ciphertext expansion: $\widetilde{\Theta}(1)$
- Processing time: $\widetilde{\Theta}(n)$ per message bit
- Key size: $\widetilde{\Theta}\left(n^{2}\right)$

## More on Regev's encryption

- This scheme is homomorphic for addition: add ciphertexts
- IAnd also for multiplication: tensor ciphertexts
$\Rightarrow$ Can be turned into FHE [Br12]

## More on Regev's encryption

- This scheme is homomorphic for addition: add ciphertexts
- IAnd also for multiplication: tensor ciphertexts
$\Rightarrow$ Can be turned into FHE [Br12]
- Enc and KeyGen may be swapped: dual-Regev [GePeVa08] $\Rightarrow$ This allows ID-based encryption, and more
$\qquad$

## More on Regev's encryption

- This scheme is homomorphic for addition: add ciphertexts
- IAnd also for multiplication: tensor ciphertexts
$\Rightarrow$ Can be turned into FHE [Br12]
- Enc and KeyGen may be swapped: dual-Regev [GePeVa08]
$\Rightarrow$ This allows ID-based encryption, and more
May be turned into a practical scheme [Pe14]
- Use Ring-LWE rather than LWE: more efficient
- Ciphertext expansion can be lowered to essentially 1
- IND-CCA security can be achieved efficiently in the ROM

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

## Euclidean lattices

Lattice $L=\sum_{i=1}^{n} \mathbb{Z} \mathbf{b}_{i} \subset \mathbb{R}^{n}$, for some linearly indep. $\mathbf{b}_{i}$ 's.

Minimum $\lambda(L)=\min (\|\mathbf{b}\|: \mathbf{b} \in L \backslash \mathbf{0})$.

find $\mathbf{b} \in L$ minimizing $\|\mathbf{b}-\mathbf{t}\|$

## Euclidean lattices

Lattice $L=\sum_{i=1}^{n} \mathbb{Z} \mathbf{b}_{i} \subset \mathbb{R}^{n}$,
for some linearly indep. $\mathbf{b}_{i}$ 's.
Minimum $\lambda(L)=\min (\|\mathbf{b}\|: \mathbf{b} \in L \backslash \mathbf{0})$.

SVP ${ }_{\gamma}$ : Given as input a basis of $L$, find $\mathbf{b} \in L$ s.t. $0<\|\mathbf{b}\| \leq \gamma \cdot \lambda(L)$.
 a vector $\mathbf{t}$ s.t. $\operatorname{dist}(\mathbf{t}, L)$ find $\mathbf{b} \in L$ minimizing $\| \mathbf{b}-\mathrm{t}$

## Euclidean lattices

Lattice $L=\sum_{i=1}^{n} \mathbb{Z} \mathbf{b}_{i} \subset \mathbb{R}^{n}$,
for some linearly indep. $\mathbf{b}_{i}$ 's.
Minimum $\lambda(L)=\min (\|\mathbf{b}\|: \mathbf{b} \in L \backslash \mathbf{0})$.

SVP $_{\gamma}$ : Given as input a basis of $L$, find $\mathbf{b} \in L$ s.t. $0<\|\mathbf{b}\| \leq \gamma \cdot \lambda(L)$.
$\mathrm{BDD}_{\gamma}$ : Given as input a basis of $L$, and a vector $\mathbf{t}$ s.t. $\operatorname{dist}(\mathbf{t}, L)<\frac{1}{2 \gamma} \cdot \lambda(L)$, find $\mathbf{b} \in L$ minimizing $\|\mathbf{b}-\mathbf{t}\|$.

## Best known (classical/quantum) algorithms

SVP $_{\gamma}$ : Given $L$, find $\mathbf{b} \in L$ s.t. $0<\|\mathbf{b}\| \leq \gamma \cdot \lambda(L)$. $\mathrm{BDD}_{\gamma}$ : Given $L$ and $\mathbf{t} \in \mathbb{R}^{n}$ s.t. $\operatorname{dist}(\mathbf{t}, L)<\frac{1}{2 \gamma} \cdot \lambda(L)$, find $\mathbf{b} \in L$ minimizing $\|\mathbf{b}-\mathbf{t}\|$.

For small $\gamma$ : [AgDaReSD15]

## Best known (classical/quantum) algorithms

SVP $_{\gamma}$ : Given $L$, find $\mathbf{b} \in L$ s.t. $0<\|\mathbf{b}\| \leq \gamma \cdot \lambda(L)$. $\mathrm{BDD}_{\gamma}$ : Given $L$ and $\mathbf{t} \in \mathbb{R}^{n}$ s.t. $\operatorname{dist}(\mathbf{t}, L)<\frac{1}{2 \gamma} \cdot \lambda(L)$, find $\mathbf{b} \in L$ minimizing $\|\mathbf{b}-\mathbf{t}\|$.

For small $\gamma$ : [AgDaReSD15]

- Time $2^{n / 2}$.
- In practice: up to $n \approx 120$ (with other algorithms).

## Best known (classial/quantum) algorithms

SVP $_{\gamma}$ : Given $L$, find $\mathbf{b} \in L$ s.t. $0<\|\mathbf{b}\| \leq \gamma \cdot \lambda(L)$.
$\mathrm{BDD}_{\gamma}$ : Given $L$ and $\mathbf{t} \in \mathbb{R}^{n}$ s.t. $\operatorname{dist}(\mathbf{t}, L)<\frac{1}{2 \gamma} \cdot \lambda(L)$, find $\mathbf{b} \in L$ minimizing $\|\mathbf{b}-\mathbf{t}\|$.

For small $\gamma$ : [AgDaReSD15]

- Time $2^{n / 2}$.
- In practice: up to $n \approx 120$ (with other algorithms).

For $\gamma=n^{\Omega(1)}: \quad$ BKZ [ScEu91,HaPuSt11]

- Time $\left(\frac{n}{\log \gamma}\right)^{\mathcal{O}\left(\frac{n}{\log \gamma}\right)}$.
- In practice, we can reach $\gamma \approx 1.01^{n}$ [ChNg11].
https://github.com/dstehle/fplll

## Hardness of SVP

## GapSVP $_{\gamma}$

Given a basis of a lattice $L$ and $d>0$, assess whether

$$
\lambda(L) \leq d \quad \text { or } \quad \lambda(L)>\gamma \cdot d .
$$

## Hardness of SVP

## GapSVP ${ }_{\gamma}$

Given a basis of a lattice $L$ and $d>0$, assess whether

$$
\lambda(L) \leq d \quad \text { or } \quad \lambda(L)>\gamma \cdot d .
$$

- NP-hard
when $\gamma \leq \mathcal{O}(1) \quad$ (random. red.) $\quad$ [Aj98,HaRe07]
- In NP $\cap$ coNP when $\gamma \geq \sqrt{n}$
- In $\mathbf{P}$
[GoGo98,AhRe04]

$$
\begin{align*}
& \text { when } \gamma \geq \sqrt{n}  \tag{BKZ}\\
& \text { when } \gamma \geq \exp \left(n \cdot \frac{\log \log n}{\log n}\right)
\end{align*}
$$

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

Each LWE sample gives $\approx \log _{2} \frac{1}{\alpha}$ bits of data on secret $\mathbf{s}$.
With a few samples, $\mathbf{s}$ is uniquely specified. How to find it?

## Exhaustive search

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

1st variant:

- Try all the possible $\mathbf{s} \in \mathbb{Z}_{q}^{n}$.
- Test if $\mathbf{b}-\mathbf{A} \cdot \mathbf{s}$ is small.
$\Rightarrow$ Cost $\approx q^{n}$.

2nd variant:

## Exhaustive search

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

1st variant:

- Try all the possible $\mathbf{s} \in \mathbb{Z}_{q}^{n}$.
- Test if $\mathbf{b}-\mathbf{A} \cdot \mathbf{s}$ is small.
$\Rightarrow$ Cost $\approx q^{n}$.

2nd variant:

- Try all the possible $n$ first error terms.
- Recover the corresponding s, by linear algebra.
- Test if $\mathbf{b}-\mathbf{A} \cdot \mathbf{s}$ is small.
$\Rightarrow$ Cost $\approx(\alpha q \sqrt{\log n})^{n}$.

## Solving LWE with BKZ (1/2)

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

Let $L_{\mathbf{A}}=\left\{\mathbf{x} \in \mathbb{Z}^{m}: \exists \mathbf{s} \in \mathbb{Z}^{n}, \mathbf{x}=\mathbf{A s}[q]\right\}=\mathbf{A} \mathbb{Z}_{q}^{n}+q \mathbb{Z}^{m}$.

## Solving LWE with BKZ (1/2)

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

Let $L_{\mathbf{A}}=\left\{\mathbf{x} \in \mathbb{Z}^{m}: \exists \mathbf{s} \in \mathbb{Z}^{n}, \mathbf{x}=\mathbf{A s}[q]\right\}=\mathbf{A} \mathbb{Z}_{q}^{n}+q \mathbb{Z}^{m}$.

- $L_{A}$ is a lattice of dimension $m$.

This is a BDD instance in $\operatorname{dim} m$ with

## Solving LWE with BKZ (1/2)

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

Let $L_{\mathbf{A}}=\left\{\mathbf{x} \in \mathbb{Z}^{m}: \exists \mathbf{s} \in \mathbb{Z}^{n}, \mathbf{x}=\mathbf{A s}[q]\right\}=\mathbf{A} \mathbb{Z}_{q}^{n}+q \mathbb{Z}^{m}$.

- $L_{A}$ is a lattice of dimension $m$.
- Whp, its minimum satisfies $\lambda(L) \approx \sqrt{m} \cdot q^{1-\frac{n}{m}}$.

## Solving LWE with BKZ (1/2)

Assume we are given $\mathbf{A}$ and $\mathbf{b}=\mathbf{A s}+\mathbf{e}$, for some $\mathbf{e}$ whose entries are $\approx \alpha \boldsymbol{q}$. We want to find $s$.

Let $L_{\mathbf{A}}=\left\{\mathbf{x} \in \mathbb{Z}^{m}: \exists \mathbf{s} \in \mathbb{Z}^{n}, \mathbf{x}=\mathbf{A s}[q]\right\}=\mathbf{A} \mathbb{Z}_{q}^{n}+q \mathbb{Z}^{m}$.

- $L_{A}$ is a lattice of dimension $m$.
- Whp, its minimum satisfies $\lambda(L) \approx \sqrt{m} \cdot q^{1-\frac{n}{m}}$.
- We have $\operatorname{dist}(\mathbf{b}, L)=\|\mathbf{e}\| \approx \sqrt{m} \alpha q$.

## LWE reduces to BDD

This is a BDD instance in $\operatorname{dim} m$ with $\gamma \approx q^{-\frac{n}{m}} / \alpha$.

## Solving LWE with BKZ (2/2)

## LWE reduces to BDD

This is a BDD instance in $\operatorname{dim} m$ with $\gamma \approx q^{-\frac{n}{m}} / \alpha$.
Cost of BKZ: $\left(\frac{m}{\log \gamma}\right)^{\mathcal{O}\left(\frac{m}{\log \gamma}\right)}$, with $\frac{\log \gamma}{m}=\frac{1}{m} \log \frac{1}{\alpha}-\frac{n \log q}{m^{2}}$.
Cost is minimized for $m \approx \frac{2 n \log q}{\log \frac{1}{\alpha}}$.

## Solving LWE with BKZ (2/2)

## LWE reduces to BDD

This is a BDD instance in $\operatorname{dim} m$ with $\gamma \approx q^{-\frac{n}{m}} / \alpha$.
Cost of BKZ: $\left(\frac{m}{\log \gamma}\right)^{\mathcal{O}\left(\frac{m}{\log \gamma}\right)}$, with $\frac{\log \gamma}{m}=\frac{1}{m} \log \frac{1}{\alpha}-\frac{n \log q}{m^{2}}$.
Cost is minimized for $m \approx \frac{2 n \log q}{\log \frac{1}{\alpha}}$.

## Cost of BKZ to solve LWE

$$
\text { Time: }\left(\frac{n \log q}{\log ^{2} \alpha}\right)^{\mathcal{O}\left(\frac{n \log q}{\log ^{2} \alpha}\right)}
$$

## Hardness results on LWE

Assume that $\alpha q \geq 2 \sqrt{n}$.

## [Re05]

If $q$ is prime and $\leq n^{\mathcal{O}(1)}$, then there exists a quantum polynomial-time reduction from $\operatorname{SVP}_{\gamma}$ in $\operatorname{dim} n$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

## Hardness results on LWE

Assume that $\alpha q \geq 2 \sqrt{n}$.

## [Re05]

If $q$ is prime and $\leq n^{\mathcal{O}(1)}$, then there exists a quantum polynomial-time reduction from $\mathrm{SVP}_{\gamma}$ in $\operatorname{dim} n$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

## [BrLaPeReSt13]

If $q$ is $\leq n^{\mathcal{O}(1)}$, then there exists a classical polynomial-time reduction from GapSVP ${ }_{\gamma}$ in $\operatorname{dim} \sqrt{n}$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

- The two results are incomparable.
- Best achievable $\gamma$ here: $n$
- In the case of Regev's encryption, we get
- One can use BDD instead (with a different $\gamma$ ).

## Hardness results on LWE

Assume that $\alpha q \geq 2 \sqrt{n}$.

## [Re05]

If $q$ is prime and $\leq n^{\mathcal{O}(1)}$, then there exists a quantum polynomial-time reduction from $\mathrm{SVP}_{\gamma}$ in $\operatorname{dim} n$ to $\mathrm{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

## [BrLaPeReSt13]

If $q$ is $\leq n^{\mathcal{O}(1)}$, then there exists a classical polynomial-time reduction from GapSVP ${ }_{\gamma}$ in $\operatorname{dim} \sqrt{n}$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

- The two results are incomparable.
- Best achievable $\gamma$ here: $n$.
- In the case of Regev's encryption, we get $\gamma \approx n^{3 / 2}$.
- One can use BDD $_{\gamma}$ instead (with a different $\gamma$ ).

## Road-map

- Definition of the LWE problem
- Regev's encryption scheme
- Lattice problems
- Hardness of LWE
- Equivalent problems

## LWE variants

Numerous variants have been showed to be at least as hard as LWE, up to polynomial factors in the noise rate $\alpha$ :
(Polynomial in $n, \log q$ and possibly in the number of samples $m$.)

- When $\mathbf{s}$ is distributed from the error distribution.
- When $\mathbf{s}$ is binary with sufficient entropy.
- When $\mathbf{e}$ is uniform in a hypercube.
- When e corresponds to a deterministic rounding of As.
- When $\mathbf{A}$ is binary (modulo $q$ ).
- When some extra information on $\mathbf{e}$ is provided.
- When the first component of $\mathbf{e}$ is zero.

## LWE in dimension 1

## 1-dimensional LWE [BoVe96]

With non-negl. prob. over $s \hookleftarrow U\left(\mathbb{Z}_{q}\right)$ : distinguish between

$$
(a, a \cdot s+e) \text { and }(a, b) \quad\left(\text { over } \mathbb{Z}_{q}^{2}\right),
$$

where $a, b \hookleftarrow U\left(\mathbb{Z}_{q}\right), e \hookleftarrow D_{\mathbb{Z}, \alpha q}$.

## Hardness of 1-dim LWE [BrLaPeReSt13]

For any $n, q, n^{\prime}, q^{\prime}$ with $n \log q \leq n^{\prime} \log q^{\prime}$ :
there exists a polynomial-time reduction from $\mathrm{LWE}_{n, q, \alpha}$ to $\mathrm{LWE}_{n^{\prime}, q^{\prime}, \alpha^{\prime}}$ for some $\alpha^{\prime} \leq \alpha \cdot(n \log q)^{O(1)}$.
$\Rightarrow \mathrm{LWE}_{1, q^{n}}$ is no easier than $\mathrm{LWE}_{n, q}$.

## Approximate gcd

## $\mathrm{AGCD}_{\mathcal{D}, N, \alpha} \quad$ [HGO1]

With non-negl. prob. over $p \hookleftarrow \mathcal{D}$, distinguish between

$$
u \text { and } q \cdot p+r \quad(\text { over } \mathbb{Z})
$$

where $u \hookleftarrow U([0, N)), q \hookleftarrow U\left(\left[0, \frac{N}{p}\right)\right), r \hookleftarrow\left\lfloor D_{\alpha p}\right\rceil$.

## Hardness of AD (Informal) [ChSt15]

$\mathrm{AGCD}_{\mathcal{D}, N, \alpha}$ is computationally equivalent to $\mathrm{LWE}_{n, q, \alpha}$, for some $\mathcal{D}$ of mean $\approx q^{n}$ and some $N \approx q^{2 n}$.

## Conclusion

LWE:

- LWE is hard for almost all instances.
- It seems exponentially hard to solve, even quantumly.
- It is a rich/expressive problem, convenient for cryptographic design.

Lattices:

- LWE hardness comes from lattice problems.
- We can design lattice-based cryptosystems without knowing lattices!

## Exciting topics I did not mention

- The Small Integer Solution problem (SIS)
$\Rightarrow$ Digital signatures.
- Ideal lattices, Ring-LWE, Ring-SIS, NTRU
$\Rightarrow$ Using polynomial rings (a.k.a. structured matrices) to get more efficient constructions.
- Implementation of lattice-based primitives.

These will be addressed in Léo's talk (Friday morning), my second talk (Friday afternoon) and Tim's talk (Friday afternoon).

## Open problems: foundations

If $q$ is prime and $\leq n^{\mathcal{O}(1)}$, then there exists a quantum polynomial-time reduction from $\operatorname{SVP}_{\gamma}$ in $\operatorname{dim} n$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

If $q$ is $\leq n^{\mathcal{O}(1)}$, then there exists a classical polynomial-time reduction from GapSVP ${ }_{\gamma}$ in $\operatorname{dim} \sqrt{n}$ to $\operatorname{LWE}_{n, q, \alpha}$, with $\gamma \approx n / \alpha$.

- Does there exist a classical reduction from n-dimensional $\mathrm{SVP}_{\gamma} / \mathrm{BDD}_{\gamma}$ to $\mathrm{LWE}_{n, q, \alpha}$ ?
Does there exist a quantum algorithm for LWE ${ }_{n . q . \alpha}$ that runs in time $2^{\sqrt{n}}$ (when $\left.q \leq n^{\mathcal{O}(1)}\right)$ ?
- Is MN/E nasy for somen $-1 / n \mathcal{O}(1)$ ?
